

N Scale Mikado Spare Parts (in the baggy with the spare traction tires)

Our design team found it necessary to cut out a pie shape on each cylinder to allow for the pilot truck to swivel (particularly on a tighter radius like a 9.75), but for customers that want the model for static display, or have a large radius on their layout, we provided the "slices" to that cut out on the cylinders.

We recommend a tiny drop of glue on the post(s) of those slices if the model is to be run with them installed so that there is no possibility of them falling out on the track while running.
